

Dear Students, Parents, Alumni, and Staff,

I am delighted to inform you of changes to our grading policy that will improve the quality of our education, strengthen our reputation, and increase opportunities for <institution> students and graduates.

First, 5-8 page papers will be written in school, not at home. We will be setting aside one entire day, every two weeks, during which students write papers under supervision and without AI. They will receive the writing prompts first thing in the morning, and have the whole day to write the paper. During this time, they have no access to AI. In addition, since they only get the prompts once they arrive, they will not be able to memorize an AI-generated paper the night before. Students who miss the writing day will get a different prompt on a makeup day.

Similarly, all graded math and science homework will be done in school, where students are supervised and have no access to AI. To make this possible, students will watch lectures at home (where AI provides no advantage), ask questions in school, and do graded assignments in school.

Finally, for term papers, which are too long and involved to be written in a single day, we have adopted monthly AI audits. Each month, we will use the latest AI detectors on all old papers. This ensures that any student eventually gets caught. While a student may manage to get an AI-generated paper past a current AI detector, it is unlikely that such a paper will fool an AI detector from several years in the future. Our policy of notifying universities, employers, and professional organizations as soon as any AI-based fraud is discovered will create a tremendous disincentive for AI use.

What this means is that the <institution> name is a badge of the kind of verified, real excellence that is increasingly rare. We have begun sharing these updates with universities and employers, so that our student's real achievements lead to improved opportunities for higher education and employment.

<school motto>

Sincerely,
